## Motivation

- Meta learning (learning to learn) algorithms facilitate few-shot learning
- Model-agnostic meta learning (MAML) [1]
- Meta-learning phase: learn from tasks T₁...T₂
- Target learning phase: few shot learning on T<sub>n+1</sub>
- The good:
  - Model-agnostic: no requirement for the network structure
- Very little labeled data needed at the target phase
- The bad:
- A lot of labeled data needed at the meta-learning phase
- Tasks T<sub>1</sub>...T<sub>n</sub> need to be drawn from the same distribution as the target - we need good knowledge of the target domain

#### Our Idea

# Keep the general flow of MAML but use unlabeled data for meta-learning!

Algorithm 1: Unsupervised Meta-learning with Tasks constructed by Random sampling and Augmentation (UMTRA) **require:** N: class-count,  $N_{MB}$ : meta-batch size,  $N_U$ : no. of updates **require**:  $\mathcal{U} = \{ \dots x_i \dots \}$  unlabeled dataset **require**:  $\alpha$ ,  $\beta$ : step size hyperparameters **require:** A: augmentation function randomly initialize  $\theta$ ; while not done do for i in  $1 \dots N_{MB}$  do Sample N data points  $x_1 \dots x_N$  from  $\mathcal{U}$ ;  $\mathcal{T}_i \leftarrow \{x_1, \dots x_N\};$ foreach  $\mathcal{T}_i$  do Generate training set  $\mathcal{D}_i = \{(x_1, 1), \dots (x_N, N)\};$ for j in  $1 \dots N_U$  do Evaluate  $\nabla_{\theta'_i} \mathcal{L}_{\mathcal{T}_i}(f_{\theta'_i})$ ; Compute adapted parameters with gradient descent:  $\theta'_i = \theta'_i - \alpha \nabla_{\theta'_i} \mathcal{L}_{\mathcal{T}_i}(f_{\theta'_i})$ ; Generate validation set for the meta-update  $\mathcal{D}'_i = \{(\mathcal{A}(x_1), 1), \dots, (\mathcal{A}(x_N), N)\}$ Update  $\theta \leftarrow \theta - \beta \nabla_{\theta} \sum_{\mathcal{T}_i} \mathcal{L}_{\mathcal{T}_i}(f_{\theta'_i})$  using each  $\mathcal{D}'_i$ ;

# Unsupervised Meta-learning with Tasks constructed by Random sampling and Augmentation (UMTRA)

- Start with an unlabeled data set D of samples
- We assume a large number of classes C present, but we don't know the class of each sample
- Generate synthetic one shot training tasks T<sub>1</sub>...T<sub>r</sub>
  - Random selection of samples with artificial labels
  - The large number of classes ensures high likelihood that classes are different
- Create validation data by augmentation  $x_{ij} = A(x)$
- Augmentation type varies by domain, the objective is to maintain class membership of the augmented data
- Augmentation on image type data (Omniglot | MinilmageNet)

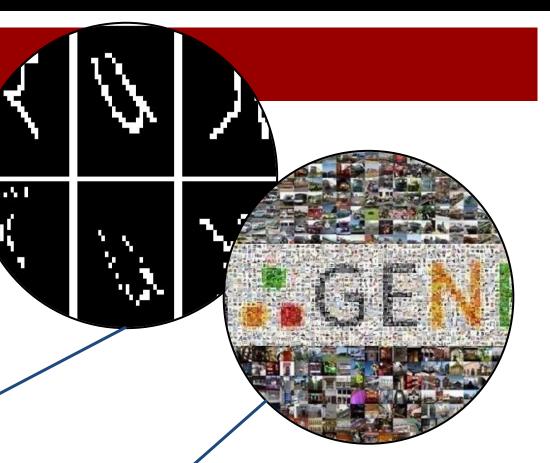

- On video: use frame selection to create augmented video
- C3D architecture
- Sample a sequence of length 16 from each video
- Kinetics for meta-learning and UCF101 for test

## Experiments

• Few shot learning benchmarks: outperforms other unsupervised algorithms and alternates for best with CACTUs-MAML [2].

 Massive reduction of required labeled data: 25000 to 25 for Omiglot (5,5) for 95.43% vs 98.83 vs MAML.

		Omniglot			Mini-Imagenet

Works on video classification as well: Test on **all samples** of each class by looking at just **one example** for train

Algorithm	Test Accuracy / F1-Score
Training from scratch	29.30 / 20.48
Pre-trained on Kinetics	45.51 / 42.49
UMTRA on unlabeled Kinetics (ours)	60.33 / 58.47
Supervised MAML on Kinetics	71.08 / 69.44

Works on unbalanced datasets (CelebA used for face recognition)

Algorithm (N, K)	(5, 1)	(5, 5)	(5, 10)
Training from scratch	26.86	39.65	50.61
UMTRA	33.43	50.19	58.84

This research is based upon work supported in parts by the National Science Foundation under Grant numbers IIS-1409823 and IIS-1741431 and Office of the Director of National Intelligence (ODNI), Intelligence Advanced Research Projects Activity (IARPA), via IARPA R&D Contract No. D17PC00345.
